60080079 Introduction to Statistical Methods Semester 2 2023-2024 Handout 12

A Brief Introduction to Two-Way ANOVA in SPSS

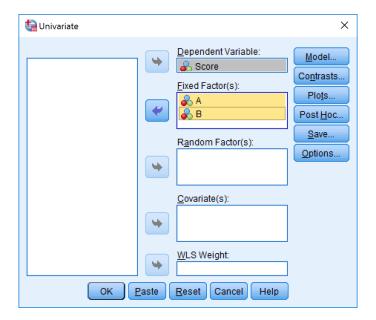

1. Set up the <u>Week12_2way</u> data, which require one variable (e.g., Score) to be quantitative, and the two other variables (e.g., A and B) to be categorical.

| 🔖 *SPSS_2way.sav [DataSet2] - IBM SPSS Statistics Data Editor | | | | | | |
|---|--------------|--------------|-------------------|--------------------------|----|--|
| <u>F</u> ile <u>E</u> dit | <u>V</u> iew | <u>D</u> ata | <u>T</u> ransform | <u>A</u> nalyze <u>G</u> | Γā | |
| | | Ü, | | Z | J | |
| 20 : | | | | | | |
| | Score | | Α | В | | |
| 1 | 10.00 | | 1.00 | 1.00 | | |
| 2 | 9.00 | | 1.00 | 1.00 | | |
| 3 | | 8.00 | 1.00 | 1.00 | | |
| 4 | 7.00 | | 1.00 | 1.00 | | |
| 5 | 11.00 | | 1.00 | 2.00 | | |
| 6 | 8.00 | | 1.00 | 2.00 | | |
| 7 | | 0.00 | 1 00 | 2 00 | | |

2. From the menu, Analyze → General Linear Model → Univariate.

3. In the **Univariate** dialog box, click in Score in the **Dependent Variable** box, and A and B in the **Fixed Factor(s)** box.

4. Click **OK**.

We should get the following output.

1) For each factor, a table that indicates how many subjects there are for each level of the factor.

Between-Subjects Factors

| | | N |
|---|------|----|
| Α | 1.00 | 12 |
| | 2.00 | 12 |
| | 3.00 | 12 |
| В | 1.00 | 12 |
| | 2.00 | 12 |
| | 3.00 | 12 |

2. The ANOVA table for the two-way model.

Tests of Between-Subjects Effects

Dependent Variable: Score

| Dopondont variable. | 00010 | | | | |
|---------------------|-----------------|----|-------------|---|------|
| | Type III Sum of | | | | |
| Source | Squares | df | Mean Square | F | Sig. |

| Corrected Model | 453.389 ^a | 8 | 56.674 | 22.420 | .000 |
|-----------------|----------------------|----|----------|----------|------|
| Intercept | 4601.361 | 1 | 4601.361 | 1820.319 | .000 |
| Α | 413.556 | 2 | 206.778 | 81.802 | .000 |
| В | 2.056 | 2 | 1.028 | .407 | .670 |
| A * B | 37.778 | 4 | 9.444 | 3.736 | .015 |
| Error | 68.250 | 27 | 2.528 | | |
| Total | 5123.000 | 36 | | | |
| Corrected Total | 521.639 | 35 | | | |

a. R Squared = .869 (Adjusted R Squared = .830)

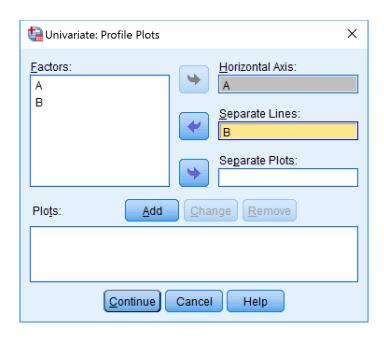

The results for the overall effect is given in the Corrected Model row; the results for the main effects due to Factor A, Factor B, and interactions are given in rows A, B ad A * B, respectively.

The results indicate that the 9 groups are not identical, and there is a main effect due to Factor A, an interaction effect, but no main effect due to Factor B.

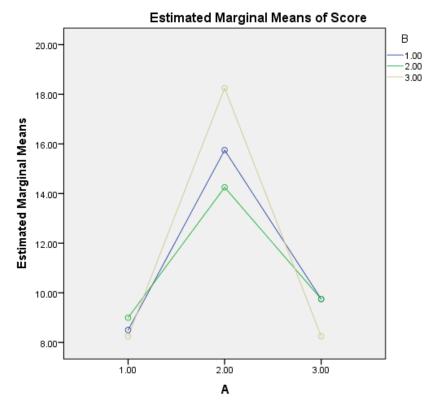

Aside: To visualize the pattern of the cell means, we can use **Plots** button in the Univariate dialog box.

Click in one factor in the **Horizontal Axis** box, and another factor in the **Separate Lines** box.

Make sure to click the **Add** button to specify A*B in the **Plots** box.

We should get the following plot:

The graph shows that the means of Factor A are different (Group 2 is much higher); the means of Factor B are quite similar; and there is an interaction between Factors A and B (the lines intersect).
